ABSTRACT:
The present invention relates to photo-labile pro-**fragrances**, as well as a **fragrance** raw material delivery system with an aesthetic benefit comprising: (i) from about 0.001% to about 100% by wt., of a photo-labile pro-***fragrance*** compd. having the formula I, wherein OR is a unit derived from a **fragrance** raw material alc., HOR; R1 is one or more electron donating groups; each R2 is independently hydrogen, C1-C12 alkyl, and mixts. thereof; X is selected from the group consisting of -OH, -NH2, -NHR3, and mixts. thereof; R3 is hydrogen, C1-C12 linear or branched alkyl, C6-C10 aryl, and mixts. thereof; and (ii) optionally from about 0.001% to about 50% by wt., of one or more **fragrance** raw materials. These delivery systems are useful for detergents, shampoos, personal care products, and fabric softeners. Thus, 1,5-dimethyl-1-vinylhex-4-enyl 3-(2,4-dihydroxyphenyl)acrylate was manufd. by reaction of 3-(2,4-dihydroxyphenyl)acrylic acid with linalool.

ABSTRACT:
The title compns. will rapidly dispense a unitized amt. of .gtoreq.1 selected fabric care agents to a wash and/or rinse bath soln. during the laundering process under a variety of conditions such that the fabric care additive is effectively deposited on the fabrics. Specifically, the compns. include a hydratable material, preferably effervescing materials, **perfume** particles and optional materials. The **perfume** particles are ***perfume*** combined with an inorg. carrier, preferably zeolite particles having a min. surface area. The deposition of the **perfume** particles on fabrics during washing and/or rinsing provides a controlled release of the ***perfume*** components from the treated fabrics for up to .gtoreq.2 wk. The retention of the **perfume** on the carrier when dispensed in an aq. soln. is improved.

ABSTRACT:

Perfume delivery compns. and/or consumable compns. include ***perfumed*** particles made of a porous inorg. mineral carrier and an absorbed and/or adsorbed **perfume** compn. The **perfume** compn. has low levels of certain classes of **perfume** ingredients that tend to be unstable when incorporated onto or into a porous mineral carrier (e.g. zeolites). Articles include the **perfume** delivery or consumable compns. (e.g. detergent), and moisture impermeable containers designed for single use or unit dosing that may include a reclosable or resealable closure.

ABSTRACT:
The essential oil from Ambrette seeds (H. abelmoschus L. synonym, Abelmoschus moschatus, Moerich) has long been used in the **perfumery** industry. The essential oil is localized mainly in the seed coat that cannot be easily sepd. from the kernel. Different methods of sepn. of the seed coat have been attempted, and none of the methods has been found to be satisfactory. A method for its selective extn. with alc. solvents and purifn. is described. A ***fragrance*** ext., free from fatty acids and fatty oil and which is superior to the steam-distd. product, was obtained in improved yields.

ABSTRACT:
Unsatd. ketones I [the broken line = optional double bond; R1 = (cyclo)alkyl, alkenyl, alkynyl, aryl; R2 = H, alkyl], useful as intermediates for ***perfumes*** , vitamins, drugs, etc., are prepd. by dropwise addn. of MeCOCH2CO2CR1R2CH:CH2 or MeCOCH2CO2CR1R2C.tplbond.CH (R1, R2 = same as above) to a system contg. 0.1-1.0 mol% (based on the acetoacetates) AlR3R4R5 (R3-R5 = alkoxy, R6O2CCH:CMeO; R6 = alkyl) as catalysts at 130-250.degree.. Thus, linalyl acetoacetate (II) was dropwise added to a mixt. of II and (iso-PrO)3Al at 170.degree. over 3 h and the reaction mixt. was stirred at 170.degree. for 1 h. The resulting reaction mixt. contained geranylacetone 77, linalool 8.1, and byproducts (geraniol and nerol) 0.2%.

ABSTRACT:
America and Australia are known to be the natural habitat of the family Myrtaceae. Six essential oils from species grown in Cuba of this family: Mithrantes ottonis Berg., Myrcianthes **fragrans** (Sw) McVaugh., Pimenta adenoclada (Urb.) Burrett., Pimenta racemosa (Miller) J. W. Moore, var. racemosa, Psidium rotundatum Griseb. and Psidium salutare (HBK) Berg., collected in the west region of Cuba, were analyzed by capillary Gas Chromatog.-Mass Spectrometry. Some of their species are endemic from Cuba (Mit. ottonis, P, adenoclada, Psi. rotundatum). Oil yields were 0,6; 1,4; 1,0; 5,0; 3,0 and 1,0 and a total of 25, 21, 33, 26, 47 and 34 volatile compds. were identified, resp. Many of them are reported for the first time.

ABSTRACT:
The yield, compn. and **fragrance** of the essential oils of 7 Metrosideros species, which are endemic to New Zealand, were examd. by GC-MS. Their compn. clearly divided the species into 2 groups. Group I oils (M. carminea, M. perforata, M. robusta, and M. umbellata) contained abundant levels of monoterpenes (28-58%), while group II oils (M. diffusa, M. excelsa, and M. fulgens) did not (0-2%). All species contained a large no. of sesquiterpenes. The compn. of the oil of each species had characteristic elements. The oil yields were low and their **fragrances** has no outstanding features.

ABSTRACT:
The biol. properties of several different **perfume** components have been investigated. It has been demonstrated, through appropriate test methods, that essential oils, absolutes and even compds. show significant (anti/pro)-radical, (anti/pro)-elastasic and (anti/pro)-tyrosinasic activities. These unexpected properties open up new opportunities for the formulation of cosmetic products and could contribute to the understanding of activities traditionally attributed to essential oils by Aromatherapy.

ABSTRACT:
The title compns. are disclosed. A double-compartment bottle contained polyglyceryl-2-stearate 0.2, PEG-8 stearate 0.135, Amisoft HS-20 0.09, isocetyl stearate 0.7, squalane 1.3, and water 7.075 g. The emulsion had a viscosity of about 7 cP at 2.degree. and pH = 7.3. The top of the bottle contained 0.5 g of ascorbic acid. By addn. of the ascorbic acid to the emulsion the pH decreased to 3.3 and the viscosity increased to 850 cP at 25.degree. forming a white cream.

ABSTRACT:
Volatile compds. liberated on rubbing the seeds of okra Abelmoschus esculentus (L.) Moench were identified. These substances were shown to be stored in lenticular formations extending along the surfaces of the seeds. Fractionation of an ethanolic ext. of the seed teguments led to identification of more than 40 compds. new to A. esculentus, including a major proportion of aliph. esters and aldehydes such as undecanal and isododecanal, which are largely responsible for the **fragrance** of the seeds.

ABSTRACT:
Essential oils were extd. from leaves of eight taxa of the genus Angophora, and then analyzed. As expected the individual components of these oils were essentially the same as those found in the Eucalyptus species of our earlier studies (Bignell et al., 1997b. Flavor **Fragrance** J. 12, 423-432). In addn., as is also the case with the bloodwood eucalypts, only relatively low yields of oil were obtained. In all cases the Cineole component was extremely small, but the oils of six of the eight contained very large concns. of the sesquiterpene Bicyclogermacrene. A table of the 52 major oil components is included. Principal components anal. (PCA) was performed on the gas chromatograms (GC) of the essential oils and the resulting scores plots compared with the cladistic classification of Thiele and Ladiges (1988). Because of the close relationship between genus Angophora and Eucalyptus "subgenus" Corymbia, the GC data for the eight Angophora taxa were combined with corresponding data for eleven randomly chosen taxa from "subgenus" Corymbia (Bignell et al., 1996b, Flavor **Fragrance** J. 11, 339-347; 1997a, Flavor **Fragrance** J. 12, 277-284) and a PCA performed on the total system.

ABSTRACT:
Macrocyclic compds. are prepd. as aroma substances for use in **perfumes** and cosmetics. Thus,a mixt. of 9Z- and 9E-15-bromopentadec-4-enecarboxylic acids (I) was prepd. by the wittig reaction of (3-carboxypropyl)triphenylphosph onium bromide and 11-bromoundecanal in the presence of potassium tert-butoxide in THF. I was then cyclized to a mixt. of Z- and E-oxacyclohexadece-5-en-2-ones in N-methylpyrrolidone in the presence of K2CO3. This compd. had musk-like odor and was used in cosmetic compns.

ABSTRACT:

The retention index variation with the column temp. was investigated for a comprehensive set of **perfumery** solutes, on Carbowax-20M glass capillary columns with 0.45 and 0.08 .mu.m film thickness. The retention indexes, the parameters of the linear equation of dependence and even the elution order are different on the 2 columns.

ABSTRACT:
The essential oils of leaves and roots of A. reticulata were investigated by GC/FID and GC/MS using different types of columns and instruments. More than 70 constituents were identified. Sesquiterpenes, like spathulenol, .delta.-cadinene, .alpha.-muurolene, elemol, .beta.-bisabolene, .beta.-caryophyllene, .alpha.-copaene, .alpha.-bergamotene, and .alpha.-eudesmol are predominant (concns. >3%) in these essential oils. The olfactoric properties of the oils and their potential uses as flavors or ***fragrances*** are also discussed.

ABSTRACT:
The temp. dependence of the retention index was studied for about 340 ***perfumery*** compds. on an SE-30 glass capillary column within usual temp. ranges. Two linear equations, with column temp. and its reciprocal as variables, were comparatively reported. The first shows a slightly better precision and is more convenient for different applications, particularly for correlation with structure.

ABSTRACT:
A synthetic racemic mixt. of (E,Z)-2,3-dihydrofarnesal was oxidized to the corresponding carboxylic acids and converted to diastereomeric (S)-phenylglycinyl amides which were sepd. by high performance liq. chromatog. Reductive amide cleavage yielded the enantiopure aldehydes. Abs. configurations were derived from proton NMR spectroscopy studies of the diastereomeric amides or from enantioselective anal. of 4-methylhexanoic acid as a product of deoxygenation and oxidative decompn. of the corresponding enantiopure dihydrofarnesols. Using enantioselective multidimensional capillary gas chromatog. (column combination PS 268/heptakis-(2,3-di-O-acetyl-6-Otert-butyldimethylsilyl)-.beta.-cyclodextrin) the direct enantioselective anal. of all four stereoisomers was achieved. The application of this method to the scent of orchids (Aerides jarckianum) and to the blossom ***fragrance*** of Citrus limon proves that genuine (E)-2,3-dihydrofarnesal has an enantiomeric distribution in the range of 85:15 in favor of the (3S)-enantiomer.

ABSTRACT:
Polypodatriene derivs. (I; R = CH2OH, COOH) extd. from a plant of the genus Commiphora, particularly the Commiphora mukul, and salts or esters thereof are described. These products and the exts. contg. them are effective cosmetic agents against wrinkles. Ethanolic ext. of C. mukul had increased the activity of glycero-3-phosphate dehydrogenase enzyme in cultured fibroblasts and thus increased the intracellular synthesis of triglycerides. An antiwrinkle cream contained Brij 72 0.8, Brij 721 2.2, Tegin 90 1.7, stearyl alc. 1.8, stearin 3.0, silicone oil 0.20, squalane 10.0, Miglyol 812 10.0, D,L-.alpha.-tocopherol 0.2, phenonip 0.5, above ext. 0.5, glycerin 5.00, Carbopol-940 0.2, 10% sodium hydroxide 0.07, wheat proteins 5.00, and **fragrances** 0.3%.

ABSTRACT:

Betaine-ester quaternary ammonium derivs. have an odoriferous alc. as releasable group (**perfume**, biocide, fungicide, etc.), such as geraniol, and are used in laundry detergents, fabric softeners, rinse aids, etc. Chloroacetyl chloride was treated with an equiv. amt. geraniol to give geranyl chloroacetate, which was quaternized with Me3N in Me2CO for 6 h at 0.degree. and 66 h at room temp. to give geranyl betainate (m.p. 92.degree.), useful for delivery of the alc. in detergent formulations.

ABSTRACT:
The title cosmetic comprising oily globule with av. diam. of .ltoreq.599 nm, preferably 200 nm, are disclosed. A hydrating cosmetic lotion contained Span-60 1.5, Tween-61 1, stearic acid 0.5, behenic acid 0.25, stearyl heptanoate 3, vaseline 1, volatile silicone oil 4, jojoba oil 2, vitamin E acetate 0.5, Q2-1403 fluid 2, Pr paraben 0.1, **perfume** 0.3, glycerin 5, Me paraben 0.3, propylene glycol 3, triethanolamine 0.25, and water q.s. 100%.

ABSTRACT:
The essential oil from wild thyme (Thymus serpyllum praecox) of French origin was analyzed by gas chromatog.-mass spectrometry (GC-MS) and 95 compds. were identified of 128 compds. sepd. The oil contained 35 hydrocarbons and heterocycles (10 monoterpenes, 20 sesquiterpenes, and 5 misc. compds.), 9 oxides (known as essential oils, such as geranium oil, rose oil, etc.), 16

aldehydes and ketones, 12 esters (mostly terpenic acetates), and 26 alcs. and was high in geranyl acetate, geraniol, and .beta.-caryophyllene. Wild thyme essential oil can be used in the food and **perfume** industries.

ABSTRACT:
Norambreinolide, having a high content of sclareolide and epi-sclareolide, is prepd. by the cyclization of tech.-grade homofarnesylic acid in the presence of a MeSO3H catalyst in an inert org. solvent (e.g., CH2Cl2) at -25.degree. to 0.degree.. Norambreinolide is a valuable intermediate in the **perfume** industry.

ABSTRACT:
The title compd. I, useful as intermediate for the known **perfume** Polywood, is prepd. by cyclization, e.g., of ester II, followed by decarboxylation. For II, wavy line indicates CC bond with cis or trans configuration; R = C1-6 alkyl; R1 = C3-6 alkyl. Cyclization of Me 7,11-dimethyl-3-(2,2-dimethylpropionoxy)-dodeca-2,6,10-trienoate in toluene contg. sulfuric acid, followed by workup and decarboxylation using NaOH, gave a product contg. 76% I.

ABSTRACT:
Fragrance compds. and essential oils with sedative effects influence the motility of mice in inhalation studies under standardized conditions. A significant drop in the motility of mice was registered following exposure to these **fragrances**. The same results were achieved when the mice were artificially induced into overagitation by i.p. application of caffeine and subsequently subjected to inhalation of **fragrance** compds. and essential oils. These results proved the sedative effects of these ***fragrants*** via inhalation exposure in lower concns. Blood samples were taken from mice after a 1-h inhalation period. Chromatog. and spectroscopic methods were used to detect and characterize the actual effective compds. after solid-phase extn. Serum concns. of 42 different substances, including ***fragrance*** compds., were found in low ranges (ng/mL serum). The results contribute to the correct interpretation of the term aroma therapy (i.e., a stimulating or sedative effect on the behavior of individuals only upon inhalation of **fragrance** compds.).

ABSTRACT:
A process for the prepn. of 2,6-dimethyl-10-methylenedodeca-2,6,11-trienal (RCHO) comprises the condensation of tiglic acid and 3-chloro-2-methyl-6-methyleneocta-1,7-dieneto form the trienecarboxylic acid, RCO2H, followed by redn. (with LiAlH4) to form a trienol, RCH2OH, and then partial oxidn. (with a 10-fold excess of MnO2). RCHO has practical application in **perfume** chem.

ABSTRACT:
.beta.,.gamma.-Unsatd. carboxylic acids are prepd. by carbonylating an allylic alc. with CO in presence of a Pd halide catalyst and, optionally, an alkali metal halide. The process is applied to nerolidol, farnesol, and their monocyclic analogs and the resulting acids are cyclized to the ambergris ***fragrance*** compd. I. Thus, trans-nerolidol was treated with CO in presence of PdCl2 and LiCl in aq. HCO2H to give 60% homofarnesic acid which was reduced with (MeOCH2CH2O)2AlH to give 73% homofarnesol (II). Cyclization of 1.002g II with BF3.Et2O gave 0.967g I.

ABSTRACT:
Terpenes I and II [R = (protected) OH, Q1; M = H, MgO, Q1-Q3; m = 1-4; n = 1-5] are prepd. by treatment of trans-M(CH2CMe:CHCH2)mMgCl (M, m = same as above) with terpenes III or IV (R, n = same as above; X = halo, Y2PO2; Y = PhO, EtO, Me2CHO, cyclohexyloxy, Me2N) in the presence of Cu cyanide and LiCl. Mg was treated with dibromoethane and iodine in THF at 20.degree. for 30 min, treated with THF soln. of prenyl chloride at -30 to -10.degree., treated with THF soln. contg. CuCN and LiCl at -30 to 20.degree. for 30 min, and treated with THF soln. of III [R = Me3CSiMe2O, X = (Me2CHO)2PO2, n = 1] at -78.degree. for 1 h to give 95% 25.4:1 trans,trans- and cis,trans-I [R = Me3CSiMe2O, M = H, m = n = 1].

ABSTRACT:
The title esters I, II, and III (R = .alpha.-tocopheryl), useful as ***fragrance*** -retaining agents for **perfumes** and antioxidants for ***perfumes*** and foods, etc., are prepd. I, II, and III may be useful as inflammation inhibitors, blood platelet aggregation inhibitors, and blood vessel-reinforcing agents. A CH2Cl2 soln. of DCC was added dropwise to a mixt. of geranylgeranic acid, .alpha.-tocopherol, DMPA, and CH2Cl2 at room temp. over 15 min and the reaction mixt. was further stirred at room temp. for 15 h to give 58% I. I was added to a lilac **perfume** compn. to show high ***fragrance*** -retaining effect and antioxidant activity.

ABSTRACT:
Cyclic terpenes I (A = CH2, CO; n = 1-4; R = H, C1-4 acyl when A = CH2; R = H, C1-4 alkyl when A = CO), useful as animal **perfumes** or their materials, are prepd. by treatment of alkatriene derivs. II, cyclohexene derivs. III, or IV with ClSO3H, followed by treatment with H2O to control temp. A soln. of II (A = CO, R = H, n = 1) in Me2CHNO2 was added to a Me2CHNO2 soln. of ClSO3H at -70.degree. over 2 min and the reaction mixt. was stirred for 20 min, then poured into ice to give (.+-.)-norambreinolide, which was recrystd. to give (.+-.)-9-epi-norambreinolide.

ABSTRACT:
The constituents of oils of P. sylvestris (2 chemotypes), Picea abies, Abies alba and A. grandis, and Pseudotsuga menziesii were studied. .alpha.-Pinene [80-56-8] (8.16-41.10%), .beta.-pinene [127-91-3] (3.00-28.43%), and limonene [5989-27-5] (0.90-34.10%) were the main constituents. In P. sylvestris

chemotype A oil, .DELTA.3-carene [13466-78-9] (43.90%) was the major constituent, while in the chemotype .beta. oil of the same species it was present only in trace amts. The biosynthesis of .DELTA.3-carene and .alpha.- and .beta.-pinene is discussed. The oils can be used in **perfumery**.

ABSTRACT:
Grignard reactions of citral with RMgX (R = Me, X = I; R = Et, Pr, Bu, X = Br) gave alcs. Me2C:CHCH2CH2CMe:CHCH(OH)R (I) which were acetylated to give the acetates or oxidized by CrO3/pyridine to give Me2C:CHCH2CH2CMe:CHCOR. Epoxidn. of I (R = Et) by Hg acetate gave epoxide II which was converted to its acetate; epoxidn. by m-ClC6H4C(O)OOH gave epoxide III. Odors for all substances are described.

ABSTRACT:
Cosmetic materials are formulated with org. Ge compds. such as bis[[1-(carboxymethyl)-3-octyltridecyl]germanium] trioxide (I) [78130-77-5]. Four org. Ge compds. were synthesized. I was prepd. by treating GeCl4 with Et3N to obtain a salt that was treated with 2-octyldodecylacrylic acid [78114-57-5] in the presence of THF and HCO2H. A topical cream for the treatment of acne was prepd. by combining I 1, squalane 10, petrolatum 9, beeswax 3, microcryst. wax 9, spermaceti wax 3, iso-Pr myristate 12, polyethylene glycol stearate 4.6, sorbitan monostearate 5, propylene glycol 10, and water 33.4 wt.% plus **perfumes** and preservatives.

ABSTRACT:
Cosmetic grooming agents for face and body contained I [73486-89-2] and (or) II [**29548-30-9**]. These compns. were useful for smoothing wrinkles, normalizing body fats and oils, improving the mech. elasticity and moisture content of the skin, and improving tissue tension. A night cream H2O-in-oil emulsion contained beeswax 8, cholesterol 2, Softisan 1, wool fat 6, Arlacel 83 3, Miglyol 812 15, safflower oil 5, Cetisol V 5, Phenonip 0.5, I 5, ***perfume*** 0.5, and H2O to 100 wt.-%. Tables were given showing the effect of this cream on wrinkle depth, skin resonance frequency, skin moisture,

and skin fat.

ABSTRACT:
The major constituents of the title plant abs. are linalool 2.1, .alpha.-terpineol 0.7, .beta.-phenethyl alc. (I) 5.1, cis-jasmone (II) 0.4, benzyl cyanide 4.7, Me anthranilate (III) 2, farnesol 7.2, indole 0.3, and Me oleate 0.2%. 0.2%. The important constituents responsible for the predominant odor of the flower are: III, indole, cis-3-hexenyl acetate, Et anthranilate, .beta.-phenethyl acetate, PhCH2CN, farnesyl acetate, geranylacetone, phenylacetaldehyde, phenylacetaldoxime, cis-sabinene, trans-sabinene, PhCO2Me, PhCO2Et, PhCHO, n-nonanal, and 6-methyl-5-hepten-2-one. The floral green character is caused by linalool, I, nerolidol, .alpha.-terpineol, 4-terpinenol, n-hexanol, cis-3-hexenol, and geraniol. The floral sweet odor is due to vanilin, II, citronellol, elemol, geranyllinalool, cis-jasmonic acid and trans-jasmonic acid. 3-Ethyl-4-methylpyridine (IV) was identified in the basic fraction.

ABSTRACT:
Isoprenoid aliph. acids, intermediates for the prepn. of insect juvenile

hormones and **perfumes**, were prepd. by selective .gamma.-alkylation of .alpha.,.beta.-unsatd. acids with allylic electrophiles via copper(I) dienolates of the .alpha.-.beta.-unsatd. acids. Thus, 1.28 g the Li-Na dienolate of (E)-PrCMe:CHCO2H, obtained by treating the acid with NaH, BuLi, and (Me2CH)2NH in THF, was treated with CuI and the formed Cu dienolate alkylated with CH2:CHCH2Br followed by methylation to give 1.5 g CH2:CH(CH2)2CPr:CHCO2Me.

ABSTRACT:
Terpenecarboxylic acids or esters H(CH2CMe:CHCH2)nCHRCO2R1 I (n = 1-3; R, R1 = H, alkyl alkenyl, cycloalkyl, cycloalkenyl, alkynyl, aryl) were prepd. by acid hydrolysis or alcoholysis of II (m = 0, 1; R2-3 = lower alkyl), which were prepd. by alkylating III with H(CH2CMe:CHCH2)nX (X = Cl, Br) or II (R = H) (IV) with RX in the presence of a strong base or by cyclizing I (R1 = H) with H2NCR2R3(CH2)mCH2OH. I are **perfumes**, antiulcer agents, or drugs for skin diseases (no data). Thus, III (m = 0, R = H, R2 = R3 = Me) was treated with BuLi in hexane at -50 to -60.degree. and stirred with geranyl bromide at room temp. for 3 hr to give 90% corresponding IV (n = 2), which was also prepd.

in 82% yield by heating geranylacetic acid with H2NCMe2CH2CH2OH. This was alkylated with bromocyclohexane and BuLi and refluxed with N H2SO4 for 14 hr to give 77% I (n = 2, R = cyclohexyl, R1 = H). Among 8 more I prepd. were (n, R, and R1 given): 3, Me, Et; 2, Me, Et; 3, H, geranyl; 3, cyclohexyl, Et.

ABSTRACT:
Me(CH2)nCH:CRCH2O2CR1 (I) were prepd. by redn. of the corresponding aldehydes with LiAlH4, followed by esterification of the alcs. Thus, Me(CH2)3CH:CPrCHO was reduced with LiAlH4 in Et2O to Me(CH2)3CH:CPrCH2OH which with Ac2O in pyridine gave I (n = 3, R = Pr, R1 = Me). Similarly prepd. were I (n = 2, R = Et, R1 = H, Me; n = 3, R = Pr, R1 = Et, heptyl, Ph, PhCH2, PhCH:CH). I had pleasant aromas.

ABSTRACT:
Treatment of trans,trans-Me2C:CH(CH2)2CMe:CH-(CH2)2CMe:CHCH2OH with PCl5, followed by KCN in Me2SO at 30.degree. gave farnesyl cyanide (I). Hydrolysis of I by KOH, followed by esterification with MeOH in H2SO4, sepn. of the isomers by chromatog. over silicic acid, and further hydrolysis by KOH gave trans,trans-homofarnesenic acid (II). Kolbe reaction of II and L-(+)-MeO2CCH2CHMeCH2CO2H gave Me (+)-3D,-7,11,15-tetramethylhexadeca-6-trans,10-trans-14-trienoate, which was reduced by LiAlH4 to the title compd. Ir and mass spectra for the enantiomers and intermediates were detd.

ABSTRACT:
The 6-octen-1-ynes and their derivs. were prepd. by ethynylation of the substituted .gamma.-pentenal to give derivs. of R1R2C:CR3-CH2CHR4CH(OH)C.tplbond.CH which were subsequently hydrogenated to the 1,2-dihydro, 1,2-tetrahydro or hexahydro-derivs. and (or) esterified. Thus, 30 min after a stream of C2H2 (I) was added to a soln. of Na inliq. NH3 which was stirred 30 min at dry ice temp., the dark-blue soln. turned grey. I was added continuously 1 hr and then 5-methyl-4-hexen-1-al in 1 l. abs. ether was added during a 30 min period. After an addnl. 2 hr treatment with I, the mixt. was treated with 120 g NH4Cl to give 3-hydroxy-7-methyl-6-octen-1-yne, b20 100.degree., n20D 1.4679 (fresh fruit-like odor). An addnl. 33 compds. were prepd. in-cluding the claimed compd. 3-hydroxy-7-isobutyl-6-octen-1-yne.

ABSTRACT:
The title compds. were prepd. by transesterification of carboxylic esters of

tertiary satd. alcs., C4-8 with tertiary unsatd. alcs., C5-20 in the presence of a usual basic transesterification catalyst (in all the examples, MeONa was used) at the boiling temp. (80-120.degree.) in 2-12 hr. The reactants were mixed in an app. contg. an efficient fractionating column and the by-products removed continuously from its head. Fractional distn. in vacuo gave good yields of pure products suitable for **fragrances**. The molar ratios were: tertiary unsatd. alc.-ester-catalyst = 1:1.5-3.0:0.05-0.02. Acetates of the following alcs. were prepd.: 2-methyl-3-buten-2-ol, b. 120-2.degree. (90% yield); linalol, b11 100.degree. (94%), .alpha.-terpineol, and nerolidol, b0.3 107.degree. (95%) as well as linalyl propionate, b19 122.degree. (85% yield).

ABSTRACT:
Title **fragrant** compds. R1R2C:CR3CH2CH2COR4 (I) (R1, R2, R3 = H or C1-40 groups, including some which form 5-7-membered rings; R4 = H, Me, or CH2CO2H are made by reaction at 110-90.degree. of R1R2C(OH)CR3:CH2 (II) with (ZO2C)2CHCOR4 (III) (Z = C1-8 alkyl), followed by ketone hydrolysis. Thus, to 1 mole III (R4 = Ph, Z = Et) at 175-80.degree. was added slowly 1.1 moles II (R1 = Et, R2 = Me, R3 = H), EtOH distd. off, CO2 evolution stopped after 3 hr, 500 ml 20% aq. NaOH and 100 ml EtOH were added, the mixt. was heated 2 hr at 80.degree. and acidified at 40.degree. to pH 1 to yield 74% I (R1 = Et, R2 = Me, R3 = H, R4 = Ph), b0.cntdot.005 94-5.degree., n25D 1.5226. Similarly 15 I were prepd.

ABSTRACT:
The title compds., RR1C:CHCH2CH(CO2Et)CR2:CHCOR3 (I), useful as ***perfumes*** or as intermediates for vitamin A and E derivs. and for plant protective agents, were prepd. from RR1C(OH)CH:CH2 and (EtO2C)2CHCR2:CHCOR3 at 50-350.degree.. Thus, Me2C(OH)CH:CH2 and (EtO2C)2CHCH:CHAc was heated .apprx.6 hr at 130-60.degree. to give 69% I (R = R1 = R3 = Me, R2 = H). Similarly prepd. were I (R, R1, R2, and R3 given): iso-Pr, Me, H, Me; Me2C:CHCH2CH2, Me, H, Me; (RR1 =)(CH2)5, H, Me; (RR1 =)(CH2)5, Me, OEt; Me2C:CHCH2CH2, Me, Me, OEt; and 2,6,6-trimethyl-1-cyclohexenylvinyl, Me, Me, OEt.

ABSTRACT:
To obtain the title compd. HAmCH2CMe(CH:CH2)O2CR (I), [wherein A = CH:CMeCH2CH2, CH2CMe:CHCH2, or CH2CHMeCH2CH2, n = 1-3, and R = C1-5 alkyl] an unsatd. branched-chain ketone, such as 6-methyl-5-hepten-2-one, was treated with CH2:CHMgCl in THF at 5.degree. and the nonisolated organomagnesium compd. (II) acylated with a C1-5 carboxylic acid anhydride at 60.degree.. I are useful in the prepn. of **perfumes**. Thus, a soln. of 1.1 moles CH2:CHMgCl in 800 ml THF was added to a soln. of 194 g 94% geranylacetone in 200 ml THF at 5.degree., the mixt. stirred at 20.degree. for 1 hr, then heated to 65.degree., 122 g Ac2O added within 30 min, and the mixt. maintained at 65.degree. for an hr more, and the product isolated as usual to give 88% nerolidyl acetate. Similarly were obtained: 87-93% .alpha.-linalyl acetate, .beta.-linalyl propionate, butyrate, valerate and phenylacetate and I (A = CH2CMe:CHCH2, n = 3, R = Me).

ABSTRACT:
Na (46 g.) in 1 l. liq. NH3 was stirred 30 min. under Dry-Ice cooling, a stream of C2H2 was passed into the blue liq. until the color suddenly changed to gray (30 min.), then for an addnl. hr. The mixt. was treated 30 min. with a soln. of 224 g. 5-methyl-4-hexen-1-al in 1 l. abs. Et2O, C2H2 passed through this mixt. during 2 hrs., the NH3 evapd., the mixt. filtered, and the filtrate evapd. to give 3-hydroxy-7-methyl-6-octen-1-yne (I), b20 100.degree., n20D 1.4679 (fresh fruit odor). A mixt. of 50 g. Ac2O, 120 mg. p-MeC6H4SO3H, and 69 g. I (temp. rose to 64.degree.), was kept 4 hrs., and treated with 250 ml. petroleum ether to give the 3-OAc deriv., b20 106.degree., n20D 1.4538. I (69 g.) in 300 ml. petroleum ether was hydrogenated over 7 g. Lindlar catalyst in the presence of 7 ml. quinoline until 11.2 l. H was absorbed (30 min.) to give 3-hydroxy-7-methyl-1,6-octadiene (II), b16 90.degree., n20D 1.4630. A mixt. of 56 g. Ac2O, 70 g. II and 1 drop H2SO4 was heated to 80.degree., kept 1 hr. at 80.degree., and worked up to give the corresponding 3-OAc deriv. b18 97.degree., n20D 1.4467 (fresh spicy odor). 2,5-Dimethyl-4-hexen-1-al (III) was ethylated as above to give 3-hydroxy-4,7-dimethyl-6-octen-1-yne (IV), b0.cntdot.01 42.degree., n20D 1.4693. IV (56 g.) gave on acetylation the 3-OAc deriv., b0.cntdot.15 60.degree., n20D 1.4456 (gardenia odor). Hydrogenation of IV in the manner described above gave the corresponding 1,6-octadiene (V), b16 93.degree., n20D 1.4652; further hydrogenation of V gave the corresponding 6-octene (VI), b16 95.degree., n20D 1.4539 (citric odor). Acetylation of V gave the 3-OAc deriv. (VII), b17 103.degree., n20D 1.4498. VII analogs prepd. were: 3-propionyloxy, b0.cntdot.08 69.degree., n20D 1.4458; isobutyryloxy, b0.cntdot.1 79.degree., n20D 1.4438; 3-benzoyloxy, b0.cntdot.05 127.degree., n20D 1.5112. Similarly prepd. were the derivs. of VI, viz., 3-OAc, b16 103.degree., n20D 1.4402; 3-propionyloxy, b0.cntdot.02 67.degree., n20D 1.4428; 3-isobutyryloxy, b0.cntdot.02 74.degree., n20D 1.4412. Ethylation of 2-ethyl-5-methyl-4-hexen-1-ol gave 3-hydroxy-4-ethyl-7-methyl-6-octen-1-yne (VIII), b0.cntdot.01 54.degree., n20D 1.4713 (cloverlike odor). Derivs. of VIII were 3-OAc, b0.cntdot.2 78.degree., n20D 1.4576; the corresponding 1,6-octadiene (IX) and the following derivs. of IX: 3-OAc, b0.cntdot.15 76.degree., n20D 1.4531; the corresponding 6-octene (X), b0.cntdot.01 70.degree., n20D 1.4580. Hydrogenation of X over Pd-C catalyst gave the corresponding octane (XI), b0.cntdot.02 62.degree., n20D 1.4404 (gooseberry odor). Also prepd. was the 3-OAc deriv. of XI, b0.cntdot.3 72.degree., n20D 1.4277. Analogously, 4,5-dimethyl-4-hexen-1-al gave 3-hydroxy-6,7-dimethyl-6-octen-1-yne (XII), b0.cntdot.02 52.degree., n20D 1.4750, and XII gave the 3-OAc deriv. b0.cntdot.15 68.degree., n20D 1.4595, and the corresponding 1,6-octadiene (XIII), b16 99.degree., n20D 1.4694. Acetylation of XIII gave the corresponding 3-OAc deriv., b0.cntdot.09 72.degree., n20D 1.4534. 5-Isobutyl-4-hexen-1-al gave 3-hydroxy-7-isobutyl-6-octen-1-yne (XIV), b0.cntdot.01 69.degree., n20D 1.4629, and XIV gave the 3-OAc deriv., b0.cntdot.15 86.degree., n20D 1.4546, and the corresponding 1,6-octadiene (XV), b0.cntdot.06 81.degree., n20D 1.4613. Acetylation of XV gave the corresponding 2-OAc deriv. b0.cntdot.02 88.degree., n20D 1.4494 (pineapple-apple odor). 4 - Cyclohexylidenebutanal gave 3 - hydroxy - 6 - cyclohexylidene-1-hexyne (XVI), b0.cntdot.15 99.degree., n20D 1.5015; the 3-OAc deriv. of (XVII) b0.cntdot.1 87.degree., n20D 1.4816 (grass-like odor), and the corresponding 1-hexene, b0.cntdot.09 97.degree., n20D 1.4770. XVII (80 g.) was treated with 80 ml. 30% soln. NaOH, and with sufficient MeOH (300 ml.) to effect dissoln. After 15 min., the soln. was neutralized with HOAc, the MeOH evapd. and the residue taken up in petroleum ether to give 3-hydroxy-6-cyclohexylidene-1-hexene, b0.cntdot.02 94.degree., n20D 1.4984. These compds. are useful odorants in

perfumes and other scented compns.

ABSTRACT:
The volatile content of the mandibular gland secretion of the male bumblebee of the species B. terrestris was isolated and analyzed. By using gas chromatog., N.M.R., ir spectroscopy, and mass spectrometry the components were: DL-2,3-dihydro-6-trans-farnesol (I), the acetate of I, Et laurate. I was synthesized. Com. farnesol contg. 2-trans, 6-trans-farnesol (II) and 2-cis, 6-trans-farnesol (III) was sepd. by chromatog. on silicic acid. For each g. of farnesol, 50 g. silicic acid was used. The solvent was petroleum ether (b.p. 40-60.degree.)-Et2O (97:3). III was eluted by petroleum ether-Et2O(90:10) and II by petroleum ether-Et2O(50:50). The purity of the isomers was checked by gas chromatog. using 10% Hyprose SP 80 as a stationary phase. II was partially hydrogenated in the following way: 0.98 g. II, 2 ml. hydrazine hydrate, CuSO4 (2 mg. in 3 drops H2O), and 5 ml. EtOH were heated on a bath at 80.degree.. O was bubbled through for 5 hrs. After adding H2O the mixt. was extd. with Et2O. The Et2O residue (0.71 g.) was dissolved in petroleum ether-Et2O (97:3) and chromatographed on 70 ml. of AgNO3 impregnated silicic acid which was prepd. as follows: 100 g. silicic acid was treated with a soln. of 50 g. AgNO3 in 200 ml. H2O. The mixt. was put under suction, filtered through a Buechner funnel, and dried overnight at 120.degree.. Eluting with petroleum ether-Et2O (4:1) followed by petroleum ether-Et2O (1:1) I was obtained. III was treated similarly. Besides I other fractions were obtained contg.: DL-6,7-dihydro-2-trans-farnesol, 10,11-dihydro-2-trans,6-trans-farnesol, DL-6,7-dihydro-2-cis-farnesol, 10,11-dihydro-2-cis,6-trans-farnesol.

ABSTRACT:
The title compds, possess a characteristic scent, different from that of the structurally related linalools, and can be used in **perfumery** compns. Thus, through a soln. of 46 g. Na in 1 l. liquid NH3, cooled in solid CO2, a stream of acetylene is passed till the blue color changes to gray. The acetylene addn. is continued 1 hr., and over 30 min., a soln. of 224 g. R7R8C:CR6CH2CHR4CHO (I) (R7 = R8 = Me, R6 = R4 = H) in 1 l. dry Et2O is added. The acetylene is passed for a further 2 hrs. to give 184 g. R7R8C:CR6CH2CHR4CH(OR3)C.tplbond.CH (II) (R7 = R8 = Me, R4 = R6 = H) (III) (R3 = H), b20 100% n20D 1.4679; fresh fruit scent. A mixt. of 55 g. Ac2O and 120 mg. p-MeC6H4SO3H and 69 g. III (R3 = H) is kept 4 hrs. to give 85 g. III (R3 = Ac), b20 106.degree., n20D 1.4538; fresh grass scent with a slight terpene nuance. III (R3 = H) (62 g.) in 300 ml. petr. ether is hydrogenated at normal conditions, using 7 g. Pd-CaCO3 catalyst and 7 ml. quinoline, till 11.1 l. H is absorbed to give R7R8C:CR6CH2CHR4CH(OR3)CH:CH2(IV)(R7 = R8 = Me, R6 = R7 = H) (V) (R3 = H), b16 90.degree. n20D 1.4630; fruit scent. ABSTRACT:
Addn. to Swiss 360,384 (see Brit. 814,636, CA 54, 9768i). Polyolefinic alcs. RCMe:CH(CH2)2CMe:CHCH2OH (I) are prepd. by the allylic rearrangement of esters RCMe:CH(CH2)2CMe(OR')CH:CH2 (II) and subsequent hydrolysis of the rearranged esters. The novel I and their esters have a rose-like odor and can be utilized as **perfume** components. Thus, a mixt. of 500 g. II (R = Et, R' = Ac) and 250 ml. AcOH is refluxed 4 hrs., the AcOH distd. in vacuo, and the residue fractionated in vacuo to give the acetate of I (R = Et) (III), b9 125.degree., n25D 1.4608. A mixt. of 29.5 g. III, 100 ml. EtOH, 50 ml. H2O, and 20 g. KOH is stirred 2 hrs. at 60.degree., allowed to stand overnight at room temp., 500 ml. H2O added, the mixt. extd. with Et2O, the ext. washed neutral with H2O, dried over anhyd. CaSO4, the Et2O evapd., and the residue distd. in vacuo to give I (R = Et), b1 89.degree., n25D 1.4748. Treatment of I (R = Et) with isobutyric anhydride in the presence of pyridine affords the isobutyrate of I (R = Et), b1.1 106.degree., n25D 1.4578. Similarly is ppd. I (R = iso-Bu), b0.08 57.degree., n25D 1.4718; acetate b0.1 78-9.degree., n25D 1.4598-1.4600; isobutyrate, b0.1.1 90.degree., n25D 1.4570.

ABSTRACT:
To a Grignard reagent prepd. from 65 g. 1-bromo-4-methyl-3-pentene and 10 g. Mg in Et2O kept at 5-10.degree. was added a soln. of 33.6 g. methyl cyclopropyl ketone (Ia) in 300 ml. Et2O. The complex was allowed to stand overnight and hydrolyzed with satd. NH4Cl. After workup, 6-methyl-2-cyclopropyl-5-hepten-2-ol (I) was obtained in 80% yield, b20 115-18.degree. and b1 72.degree., n20D 1.4660. Treatment of 67 g. I with 160 ml. 48% HBr yielded 76 g. 1-bromo-4,8-dimethyl-3,7-nonadiene (II), b1 88-92.degree.. The acetyl deriv. of II was prepd. (b1 99-102.degree.) and 8.4 g. sapond. to produce 6.3 g. 4,8-dimethyl-3,7-nonadien-1-ol, b1 96.degree. and b0.25 74-5.degree., n24.6D 1.4726. Similarly, a Grignard reagent prepd. from II, after reaction with Ia, gave 6,10-dimethyl-2-cyclopropyl-5,9-undecadien-2-ol (III), b1 128-32.degree. and b0.02 96-8.degree., n21D 1.4822. When III was treated as in the prepn. of II and I, the following compds. were obtained: 1-bromo-4,8,12-trimethyl-3,7,11-tridecatriene, b0.35 120-4.degree., n22D 1.4990; acetyl deriv. b0.15 105-8.degree.; 4,8,12-trimethyl-3,7-tridecatrien-1-ol, b0.4 115.degree., n22.5D 1.4862. These new alcs. had characteristic odors and were useful in making ***perfumes*** .

ABSTRACT:
The title compd. (I) was useful in the **perfume**, cosmetic, flavoring and pharmaceutical industries. 3,5-Dimethyl-1-hexen-3-ol (438 g.) stirred with 1500 cc. concd. HCl for 30 min. gave 1-chloro-3,5-dimethyl-2-hexene (II), n25D 1.448. EtO2CCH2COCH3 (III) (429 g.) and 162 g. NaOCH3 treated with 428 g. II at 60.degree. over 30 min. and the mixt. stirred for 6 hrs. at 60-70.degree. gave 3-car-bethoxy-6,8-dimethyl-5-nonen-2-one, straw colored oil, which was sapond. with 200 g. KOH and 200 cc. water. The product treated with acid gave, after decarboxylation, 6,8-dimethyl-5-nonen-2-one (IV), b35 120.degree. n25D 1.4432, odor of fresh apple juice; 2,4-dinitrophenylhydrazone m. 47.degree.; semicarbazone m. 114.degree.. Na (41.4 g.) in 1.5 l. liquid NH3 was treated with HC.tplbond.CH to discharge the color and then for an addnl. 30 min. This mixt. was treated 45 min. with 252 g. IV in 250 cc. Et2O with HC.tplbond.CH being passed in for 15 min. to give 3,7,9-trimethyl-1-decyn-6-en-3-ol (V), b0.35 72.degree., n25D 1.4598. V (189 g.) absorbed 0.97 mole H on redn. over 18.9 g. 5% Pd-Pd-CaCO3 to give 3,7,9-trimethyl-1,6-decadien-3-ol (VI), b20 129.degree., n25D 1.4592. VI (142 g.) stirred with 450 cc. concd. HCl gave 1-chloro-3,7,9-trimethyl-2,6-decadiene (VII), n25D 1.472. III (104 g.) and 40 g. NaOMe treated with 145.5 g. VII gave 3-carbethoxy-6,10,12-trimethyl-5,9-tridecadien-2-one (VIII). VIII was sapond. with KOH in aq. alc. and decarboxylated by acidification and warming to give I, b0.7 107-9.degree., n25D 1.4652, fruity odor.

ABSTRACT:

cf. C.A. 46, 6619f). Because the diterpene alc. manool (I) is structurally related to ambreinolide (II) which is an important starting material for the synthesis of ambra **perfumes**, a partial synthesis of II from I is carried out. Adding 7.7 g. KMnO4 (corresponding to 3 atoms O) to 7.04 g. I in 350 cc. Me2CO at 2-4.degree. over a period of 12 hrs., keeping the mixt. overnight, evapg. the decanted soln., shaking the residue together with the MnO2 with 40 g. Na2SO3 in 135 cc. 2 N H2SO4 and 200 cc. ether until the MnO2 is dissolved, evapg. the washed (H2O, 200 cc. 2 N Na2CO3, H2O) ether soln., and working up the residue in the usual way give 5.56 g. neutral (III) and 0.62 g. acid products. III is refluxed with 3.8 g. Girard reagent T in 38 cc. abs. EtOH and 3.4 cc. AcOH 1 hr. and the mixt. poured into 300 cc. ice H2O contg. 2.76 g. Na2CO3, giving 1.8 g. ketonic (IV) and 3.6 g. nonketonic products (V). Chromatographic sepn. of 3.3 g. V over Al2O3 (activity II) and elution with petr. ether-C6H6 give 3.01 g. unchanged I, m. 41-3.5.degree.. Treating 2.1 g. IV in 6.5 cc. MeOH with 11.5 cc. H2NCONHNH2 (corresponding to 1.1 g. HCl salt) gives 2.5 g. crude semicarbazone (VI), m. 182-6.degree. (decompn.), from which, on crystn. from 60 cc. MeOH and 5 cc. H2O, is obtained 2.2 g. pure VI of the Me ketone, C18H30O (VII), needles, m. 191.5-3.degree. (decompn.). Heating 2.08 g. VI with 4 g. cryst. (CO2H)2 in 20 cc. H2O 3.5 hrs. on a water bath gives 1.78 g. VII, b0.12 114-15.degree., [.alpha.]D 37.degree. (c 1.05, all rotations in CHCl3) (2,4-dinitrophenylhydrazone, yellow needles, m. 144-5.degree.). Its infrared (IR) absorption curve shows bands at 1721, 1216, and 1171 cm. -1 (AcO group) and at 895 and 1647 cm. -1 (CH2: < grouping). Adding 2.75 g. iodine in 22 cc. H2O contg. 5.5 g. KI and 2.2 g. KOH in 22 cc. H2O simultaneously over a period of 1 hr. to 400 mg. VII in 85 cc. freshly distd. dioxane at 20.degree. with stirring, stirring the mixt. another hr., adding NaHSO3, and working up the mixt. in the usual way give 90% unsatd. acid, C17H28O2 (VIII), m. 108.5-9.degree., [.alpha.]D 47.degree. (c 0.56), which gives a yellow color with C(NO2)4. The IR curve of VIII is given. From the neutral fraction CHI3, m. 116-17.degree., is isolated. Methylating 155 g. VIII with CH2N2 and ozonizing the Me ester in 20 cc. CHCl3 3 hrs. at 0.degree., evapg. the mixt. in vacuo, and treating the residue in 20 cc. AcOH with 3 knife-points Zn dust overnight give 155 mg. neutral portion from which, on chromatographic purification over Al2O3, is isolated the oxo Me ester, C17H28O3 (IX), b0.02 103.degree. (bath temp.), (2,4-dinitrophenylhydrazone, yellow leaflets, m. 115-15.5.degree.). The IR curve of IX shows bands at 1600-1700 cm.-1 [(vCO) group], at 1706 cm.-1 (C6 ring), and 1730 cm.-1 (CO2Me group). Shaking 110 mg. VIII in AcOEt with 15 mg. prereduced PtO2 causes the absorption of 11 cc. H and gives the satd. acid, C17H30O (X), needles, m. 131.degree., [.alpha.]D 39.degree. (c 0.30), which is identical with the acid obtained previously from II (cf. R. and Lardon, C.A. 40, 5715.8). Adding 195 mg. VIII in small portions to 5 cc. AcOH and 2 cc. concd. H2SO4 with ice-cooling, stirring the mixt. 2 hrs., pouring it onto ice, and extg. with ether give 99% neutral products, m. 118-19.degree., which (180 mg.), chromatographed over 5 g. Al2O3, gives 142 mg. II, m. 139-40.degree., [.alpha.]D 31.degree. (c 1.02). Warming 225 mg. VIII with 5 cc. HCO2H and 5 drops concd. H2SO4 1 hr. at 60.degree. gives 78% II, fine needles, m. 139.degree., [.alpha.]D 32.degree. (c 0.87). The IR absorption curves of II from I and from ambrein are identical.

ABSTRACT:
Nerolidol (I) and farnesol (II) can be obtained from papilionaceous, sophora, and leguminous plants. Steam distn. of the shavings of Myrocarpus fastigiatus and frondosus gives the essence of cabreuva (III). Fractional distn. of III gives 80% I semicarbazone, m. 134-5.degree.. Pure II 2% can be obtained from III by forming the 3-nitrophthalate, m. 93-4.degree., and sapong. it. III can be acetylated and fractionally distd. to give the acetate (IV) of I, b1.6 128-9.degree., d20 0.9046, nD20 1.4712. Further acetylation of III at high temp. gives acetate (V) of II. Sapon. of IV and V yields pure I and II. Dry III reacts with PBr3 in pyridine to give farnesyl bromide, from which pure II can be obtained. I and II are used in **perfumes** and as primary materials in the manuf. of compds. having vitamin activity.

ABSTRACT:
The title compns. will rapidly dispense a unitized amt. of .gtoreq.1 selected fabric care agents to a wash and/or rinse bath soln. during the laundering process under a variety of conditions such that the fabric care additive is effectively deposited on the fabrics. Specifically, the compns. include a hydratable material, preferably effervescing materials, **perfume** particles and optional materials. The **perfume** particles are ***perfume*** combined with an inorg. carrier, preferably zeolite particles having a min. surface area. The deposition of the **perfume** particles on fabrics during washing and/or rinsing provides a controlled release of the ***perfume*** components from the treated fabrics for up to .gtoreq.2 wk. The retention of the **perfume** on the carrier when dispensed in an aq. soln. is improved.

ABSTRACT:
Perfume delivery compns. and/or consumable compns. include ***perfumed*** particles made of a porous inorg. mineral carrier and an absorbed and/or adsorbed **perfume** compn. The **perfume** compn. has low levels of certain classes of **perfume** ingredients that tend to be unstable when incorporated onto or into a porous mineral carrier (e.g. zeolites). Articles include the **perfume** delivery or consumable compns. (e.g. detergent), and moisture impermeable containers designed for single use or unit dosing that may include a reclosable or resealable closure.

ABSTRACT:

Electroantennograms (EAGs) were recorded from the vine weevil, Otiorhynchus sulcatus F. (Coleoptera: Curculionidae) to a broad range of volatile plant compds. The response profile is restricted to a small no. of volatiles that evoke substantial EAGs. Large EAG responses were particularly found among green leaf volatiles (GLV) such as (E)-2-hexenol-1, (Z)-3-hexenol-1, hexanol-1, hexanal, and heptanal. Other plant volatiles eliciting responses in the weevils' antenna are 2,5-dimethylpyrazine, hexylamine, benzyl alc., 1,2-dimethoxybenzene, o-cresol, myrtenol, 3-methylcyclohexanol, .gamma.-hexalactone, and .gamma.-heptalactone. EAG responses to terpenes were generally weak. Many of the monoterpenes are characteristic for the ***odor*** of conifers, a group of plants which tend to be avoided by adult vine weevils. The EAG response to several GLV and benzene derivs. in three geog. distinct populations of the vine weevil differed, suggesting between population variation in receptor sensitivities for several compds. under test. The GLV-compn. of the **odor** profile of potential food plants may be an important criterion for a polyphagous insect like the vine weevil to be used in host-plant selection, since compds. in this **odor** group dominate so strongly the EAG response profile. In multiple food-choice situations the weevils are known to prefer certain plant species and the authors hypothesize that they combine GLV information with that of more specific plant volatiles, thereby promoting attraction or avoidance.

ABSTRACT:
In this study. the flower essential oil from Cananga **odorata** of Vietnam was studied G. and GC-MS, and IR. Twenty components of the oil, in total amounting to 93.3%, were identified. Linalool (21.3%), geranyl acetate (6.2%), .beta.-caryophyllene (7.3%), .beta.-cubebene + germacrene D + .gamma.-cadinene (27.8%) and benzyl benzoate (13.4%) were the major components of the oil.

ABSTRACT:
The aromas of a ref. green Mexican coffee (Arabica) and of a coffee from the same origin, but having a pronounced earthy/moldy off-taint, were characterized. From comparison of the 2 aroma profiles, the compds. causing the defect were detected by gas chromatog. olfactometry, isolated and concd. by preparative bi-dimensional gas chromatog., and characterized by gas chromatog.-mass spectrometry. Six compds. participated in the off-flavor. Geosmin, 2-methylisoborneol, 2,4,6-trichloroanisole were the main culprits, while 3 methoxy pyrazines (2-methoxy-3-isopropyl/-3-sec-butyl/-3-iso-butylpyrazine) contributed to a lesser extent to the earthy/green undertone. The occurrence of the off-flavor could tentatively be linked to post-harvest drying.

ABSTRACT:
The temp. dependence of the retention index was studied for about 340 ***perfumery*** compds. on an SE-30 glass capillary column within usual temp. ranges. Two linear equations, with column temp. and its reciprocal as variables, were comparatively reported. The first shows a slightly better precision and is more convenient for different applications, particularly for correlation with structure.

ABSTRACT:

Steam distn. (SD), simultaneous distn.-solvent extn. (SDE), and supercrit. (CO2) extn. (SFE) were used to isolate volatile secondary metabolites from fresh, totally mature flowers of Colombian ylang-ylang (Cananga **odorata**). The various exts. were analyzed by capillary chromatog. (DB-1, DBWAX, 60 m columns) using FID, NPD or MSD (EI, 70 eV). Kovats indexes, mass spectra, or std. substances were employed for compd. identification. The main constituents of these exts. were linalool (20.7, 28.0, and 16.5%), germacrene-D (10.1, 3.1, and 20.3%) benzylbenzoate (14.1, 2.9, and 3.9%), benzyl acetate (9.6, 17.0, and 6.2%), caryophyllene (3.1, 2.9, and 3.9%), and p-methylanisole (6.8, 6.1, and 2.7%). Heavy hydrocarbons (Cn>20) and fatty acids were found only in the SFE exts., which also had a higher content of nitrogenated compds. (phenylacetonitrile, 4-methylbenzaldoxime, indole, 2-phenyl-nitroethane, and Me anthranilate) and sesquiterpenes (43% vs 19.5% in SD and 8.1% in SDE) and 1.5-2 times lower concn. of monoterpenes and light oxygenated compds. than the SD (49.7%) and SDE (64.5%) exts.

ABSTRACT:
Tequila, the fermented and twice-distd. juice of Agave tequilana, was extd. using dichloromethane. The ext. obtained, which represented approx. 0.03% vol./vol. of the original product, was analyzed by gas chromatog. (GC), employing both flame ionization detection (FID) and sulfur chemiluminescence detection, as well as by gas chromatog.-mass spectrometry (GC-MS). More than 175 components were identified in the ext., accounting for more than 99% of the total GC FID peak area. The ext. was also subjected to sensory anal. employing the technique of GC with **odor** port evaluation/aroma ext. diln. anal. More than 60 **odorants** were detected, at least 30 of which could be correlated with specific GC peaks arising from components found in the ext. On the basis of their detection in the most dil. exts. analyzed, five constituents were detd. to be the most powerful **odorants** of tequila; these were isovaleraldehyde, isoamyl alc., .beta.-damascenone, 2-phenylethanol, and vanillin. Efforts at reconstituting tequila flavor from its component parts were not successful, however, indicating that further significant contributors to tequila flavor remain to be identified.

ABSTRACT:

Volatile secondary metabolites from Columbian ylang-ylang flowers were obtained by combined steam distn.-solvent extn. The samples were analyzed by high resoln. gas chromatog. with flame ionization, nitrogen/phosphorus, or mass spectrometric detection. The chem. compn. of the oils extd. from flowers at different stages of development differed both qual. and quant. The generation of total volatile metabolites, light oxygenated compds. in particular, increased markedly during flower maturation. In this work the quality of the ylang-ylang essential oils was studied as a function of flower maturity.

ABSTRACT:

The volatile components of the concrete from flowers of honeysuckle Lonicera japonica Thunb. were analyzed by GC and GC-MS. One hundred and fifty compds., made up of 36 hydrocarbons, 28 alcs., 21 aldehydes, 12 ketones, 38 esters and 15 misc., were identified and the important components that characterize the volatiles of honeysuckle flowers were recognized to be linalool, (Z)-jasmone, (Z)-jasmin lactone, Me jasmonate, and Me epi-jasmonate. In addn., changes of the volatile components emitted from the living flowers throughout the whole day were investigated by dynamic headspace anal. using GC and GC-MS, and the strongest **odor** was found to be emitted in the middle of the night.

ABSTRACT:
Samples of essential oil from Colombian ylang-ylang trees were analyzed by means of high-resoln. gas chromatog. (HRGC), HRGC-MS, IR and 1H- and 13C-NMR. Fifty-seven components were detected, 51 of which were pos. identified. Camphene and anethol were identified in ylang-ylang essential oil for the first time. Among the compn.-detg. variables studied (extn. time, part of the flower, and flower freshness), the extn. time and the flower condition (fresh vs. dry) were found to have the largest incidence in the quality of the essential oil.

ABSTRACT:
The solvent ext. and the headspace of Hedychium coronarium flowers were investigated by GC and GC/MS. A volatile conc. of the solvent ext. which was obtained by simultaneous distn. and extn. (SDE) was fractionated by column chromatog. and analyzed by GC and GC/MS. Of the 175 compds. identified, linalool, Me benzoate, cis-jasmone, eugenol, (E)-isoeugenol, jasmin lactone, Me jasmonate, Me epi-jasmonate, indole, nitriles and oximes were found to make a great contribution to the **scent** of the flowers. A total of 113 compds. were identified in the headspace. The daily and the seasonal changes of the **odor** characteristics of H. coronarium flowers were considered. Qual. differences of the volatiles obtained by thermal and solvent desorption of the headspace traps were also discussed.

ABSTRACT:
The essential oil of Plumeria rubra forma acutifolia (Poir.) Woodson cv. Common Yellow growing in Hawaii was extd. by simultaneous distn. and extn. The essential oil was analyzed with GC and GC-MS, and a total of 74 compds. were identified. Linalol, phenylacetaldehyde, trans,trans-farnesol, .beta.-phenylethyl alc., geraniol, .alpha.-terpineol, neral and geranial were found to make a major contribution to the floral **scent** of this flower.

ABSTRACT:
Esters, alcs., phenolic ethers, and sesquiterpenes were identified in the oil from C. **odorata**, used for manuf. of **perfumes**. High quality ***fragrance*** correlated with lower contents of sesquiterpenes and sesquiterpene alcs. Essential oils obtained when the flowers were changing from green to yellow showed high quality **fragrance**. Three varieties of C. **odorata** were different in their essential oil compn.

ABSTRACT:
Chem. compns. of 44 essential oils of ylang-ylang (C. **odorata**) from Madagascar were analyzed by glass capillary gas chromatog. (GC). Classification of these essential oils according to their com. grades (1st, 2nd, 3rd) using phys. and chem. consts. was compared to classification achieved by applying multidimensional data anal. to the GC results. Thirty-two GC peaks

were used for standardized principal-component anal. (PCA) and factorial discriminant anal. (FDA). The differentiation of the 3 groups was obtained by either PCA or FDA. By using stepwise FDA, we obsd. that only 10 compds. are needed for the correct classification of the learning set samples.

ABSTRACT:
The volatile components of bilberry, bog blueberry and cultivated high-bush blueberry (cultivar Rancocas) were analyzed by gas chromatog. and mass spectrometry. Several new compds. not reported previously as blueberry volatiles were detected. These included methyl [17417-00-4] and ethyl 2-hydroxy-3-methylbutanoate [2441-06-7], Me and ethyl 3-hydroxy-3-methylbutanoate [18267-36-2] 2-phenyethyl formate [104-62-1], methyl ***salicylate*** [119-36-8], farnesol [4602-84-0], farnesyl acetate [***29548-30-9***], vanillin [121-33-5], myristicin [607-91-0], 4-vinylphenol [2628-17-3], 2-methoxy-5-vinylphenol [621-58-9], citronellol [106-22-9], hydroxycitronellol [107-74-4] and some .gamma.- and .delta.-lactones. The character impact compds. of bilberry were the above-mentioned hydroxy esters together with 2-phenylethanol and its esters and the .gamma.- and .delta.-lactones, whereas myristicin, citronellol, hydroxycitronellol, farnesol, and farnesyl acetate were typical of the aroma of high-brush blueberry.
